Project Proposal

First Aid Hero

بطل الإسعافات الأولية

Abstract

Every year, thousands of lives are lost due to a lack of basic first aid knowledge. First Aid Hero is an educational Windows Forms application developed in C# that aims to raise awareness and build life-saving skills in an engaging and interactive way. The application presents users with real-life emergency scenarios, including burns, choking, heart attacks, fractures, and bleeding, and requires them to select the most appropriate first aid response from multiple given options. This approach encourages critical thinking and helps users recognize common misconceptions about first aid. The application tracks user performance throughout the session and generates a final report that reflects the user's overall first aid proficiency level. First Aid Hero bridges the gap between theoretical knowledge and practical readiness, empowering individuals to respond confidently and correctly in life-threatening situations.
